

### ABSTRACT OF THE DISCLOSURE

A plant container has a semi-spherical opened top cup-shaped receptacle permanently attached to a vertical back panel. The cup and back panel form a pocket for retaining soil for a plant. The back panel has at least one opening for receiving a mounting element, such as a suction cup, for removably mounting the container to a vertical supporting surface, as for example, a window pane. The back panel also defines a reservoir for water and openings in communication with the receptacle for watering a plant received in the receptacle.
